

DumbBots

Local AI Product Builder - Quick Start

IDEA	PLAN	APPROVE	TEST	RUN	DEPLOY
------	------	---------	------	-----	--------

Install once. Describe one idea. Review the plan. Approve the build. Run it locally. Start the next idea.

Supported first release

Windows 11 + WSL Ubuntu, Python projects, FastAPI web APIs, Ollama, GitHub publishing, and guided Render deployment.

1. Install once

Install Git, Python, GitHub CLI, and Ollama. Then run these commands in WSL Ubuntu:

```
cd ~/projects
git clone https://github.com/Immrtldragon98/Dumb_Bots.git dumbbots
cd dumbbots
python3 -m venv .venv
source .venv/bin/activate
pip install -r requirements.txt
ollama pull qwen2.5-coder:3b
ruff check .
pytest -q
python cli.py health
```

If Ollama cannot be reached, run `ollama serve` in another terminal. If it says the address is already in use, Ollama is already running.

2. Start every session

```
cd ~/projects/dumbbots
source .venv/bin/activate
git pull
python cli.py health
```

Copy only commands - never copy the terminal prompt or old output.

3. Plan an idea

```
python cli.py run inventory-api "Build an inventory API with create, list, update and delete operations.
Reject negative stock, include GET /health, and write tests." --profile fastapi
```

The first run is planning only. Check the ticket, acceptance criteria, target files, tests, and risks.

4. Approve the build

```
python cli.py run inventory-api "Build an inventory API with create, list, update and delete operations.
Reject negative stock, include GET /health, and write tests." --profile fastapi --approve
```

The product is saved at `projects/inventory-api/`. Every new idea receives its own folder.

5. Understand the result

Result	Meaning
ACCEPTED	Tests, QA, and Reviewer accepted the build.
REJECTED	Keep the evidence and use the bounded repair workflow.
Run report	The JSON evidence is stored under runs/.

6. Repair when QA rejects

```
python cli.py repair inventory-api "Fix every failed check and satisfy the original acceptance criteria without changing scope." --approve
```

Then run the Reviewer using the original idea. Do not delete valid tests merely to make a failure disappear.

7. Run locally

```
cd ~/projects/dumbbots/projects/inventory-api
python3 -m venv .venv
source .venv/bin/activate
pip install -r requirements.txt
ruff check .
pytest -q
uvicorn src.main:app --reload --host 0.0.0.0 --port 8000
```

Open <http://localhost:8000/docs>. Stop the server with Ctrl+C. A phone on the same network can use <http://<PC-IP>:8000/docs> when the firewall allows port 8000.

8. Publish and deploy

```
cd ~/projects/dumbbots
source .venv/bin/activate
gh auth login
python cli.py publish inventory-api --approve
python cli.py deploy-chat inventory-api
```

Only publish an accepted product. Enter secret values in the hosting dashboard, never in DumbBots chat.

Command card

Goal	Command
Health	<code>python cli.py health</code>
Inspect	<code>python cli.py inspect PROJECT</code>
Plan	<code>python cli.py run PROJECT "IDEA" --profile fastapi</code>
Build	Repeat the plan command with <code>--approve</code>
Repair	<code>python cli.py repair PROJECT "FIX" --approve</code>
Review	<code>python cli.py review PROJECT "ORIGINAL IDEA"</code>
Tests	<code>python cli.py check PROJECT pytest</code>
Style	<code>python cli.py check PROJECT ruff</code>
Publish	<code>python cli.py publish PROJECT --approve</code>
Deploy	<code>python cli.py deploy-chat PROJECT</code>

Common problems

Command not found: activate `.venv` and run from the DumbBots repository.

Ollama address already in use: Ollama is already running.

Refusing to overwrite: use a new project name or repair the existing build.

GitHub rejects password: run `gh auth login` and `gh auth setup-git`.

Import error: run tests from the generated project's root.

Production boundary

DumbBots is a local development assistant. Before serving real users, review authentication, authorization, rate limits, backups, migrations, monitoring, privacy, security testing, dependencies, and hosting configuration for that specific product.
